

# Designing Fair Machine Learning Model

Deborah D. Kanubala & Angel Gabriel

# Group Activity

- Use this dataset and fit a simple classification model of your choice:
- [https://github.com/Ghana-Data-Science-Summit-IndabaX-Ghana/IndabaX25/blob/main/Designing%20Fair%20Machine%20Learning%20Algorithms%20\(Advanced%20Level\)/default%20of%20credit%20card%20clients.xls](https://github.com/Ghana-Data-Science-Summit-IndabaX-Ghana/IndabaX25/blob/main/Designing%20Fair%20Machine%20Learning%20Algorithms%20(Advanced%20Level)/default%20of%20credit%20card%20clients.xls)
- Evaluate the performance of your model with any metric of your choice.  
However, provide justification for your choice of metric
- You are welcome to work in groups

## Black drivers get pulled over by police less at night when their race is obscured by 'veil of darkness,' Stanford study finds

After analyzing 95 million traffic stop records, filed by officers with 21 state patrol agencies and 35 municipal police forces from 2011 to 2018, researchers concluded that “police stops and search decisions suffer from persistent racial bias.”

# Machine Bias

There's software used across the country to predict future criminals. And it's biased against blacks.

by Julia Angwin, Jeff Larson, Surya Mattu and Lauren Kirchner, ProPublica

May 23, 2016

## Legally Recognized Protected Classes

**Race** (Civil Rights Act of 1964); **Color** (Civil Rights Act of 1964); **Sex** (Equal Pay Act of 1963; Civil Rights Act of 1964); **Religion** (Civil Rights Act of 1964); **National origin** (Civil Rights Act of 1964); **Citizenship** (Immigration Reform and Control Act); **Age** (Age Discrimination in Employment Act of 1967); **Pregnancy** (Pregnancy Discrimination Act); **Familial status** (Civil Rights Act of 1968); **Disability status** (Rehabilitation Act of 1973; Americans with Disabilities Act of 1990); **Veteran status** (Vietnam Era Veterans' Readjustment Assistance Act of 1974; Uniformed Services Employment and Reemployment Rights Act); **Genetic information** (Genetic Information Nondiscrimination Act)

[Boracas & Hardt 2017]

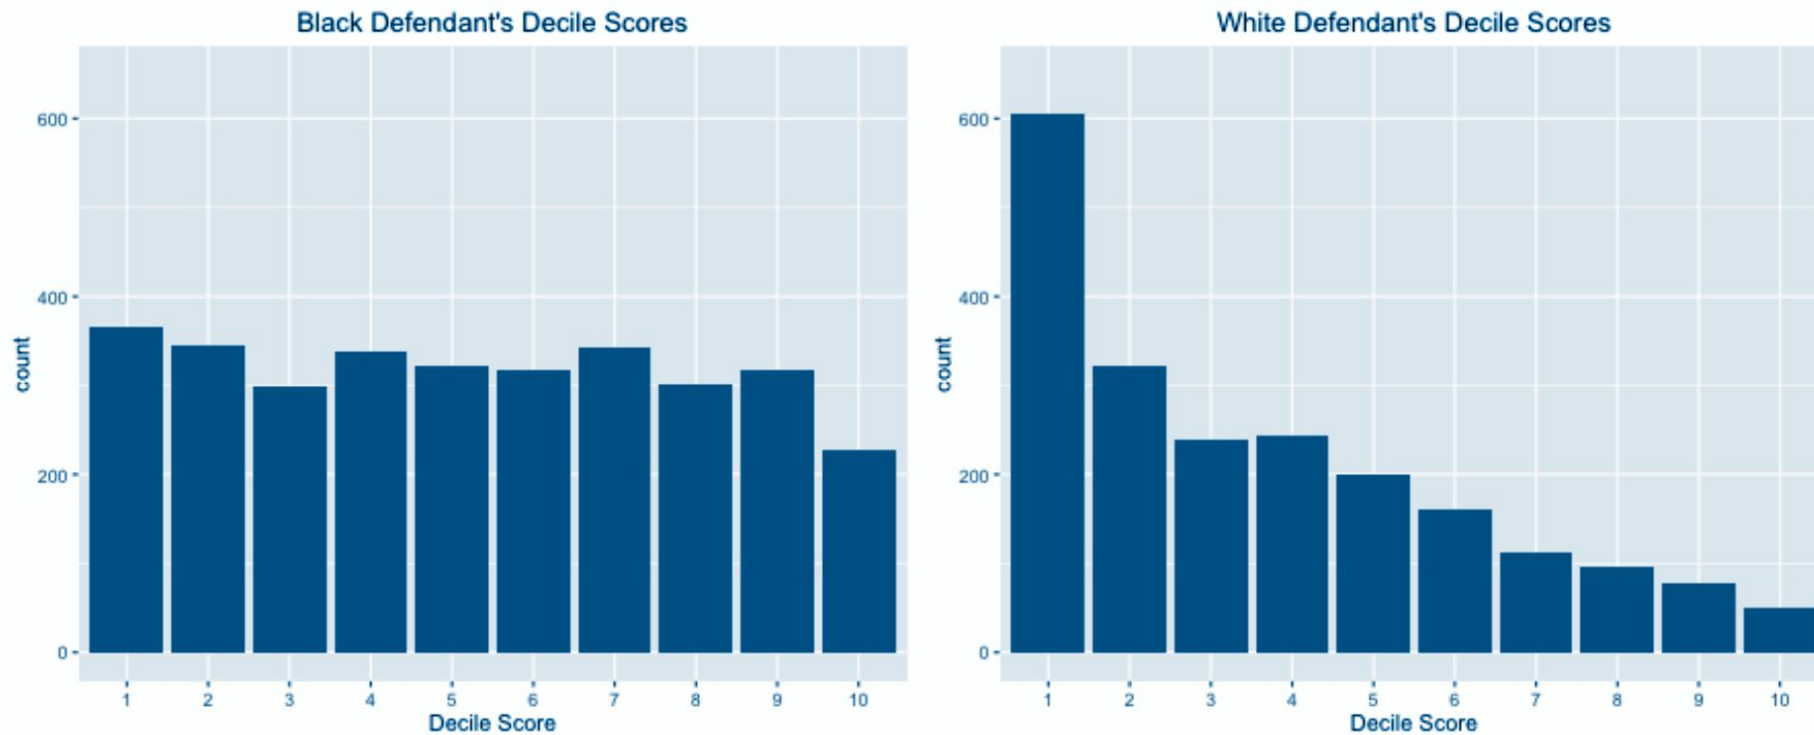

- Sample Bias: Occurs when one population is overrepresented or underrepresented in a training dataset.
- Label Bias: Occurs when annotation process introduce bias during creation of training data.
- Outcome proxy Bias: Occurs when the ML task is not specified appropriately. (Arrest - > Police arrest, Cost of health system -> quality of health.)
- Human Biases in Historical data: Historical data contains human biases and stereotypes.

# Why **Fairness** is Hard using COMPASS as case Study

# Compass Study Case

- 2016 ProPublica article analyzed COMPAS scores for >7000 people arrested in Broward county, Florida

**Question: How many of these people ended up committing new crimes within 2 years?**

# Error Metrics

	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	True Negative (TN)	False Positive (FP)
Outcome: Recidivated	<b>False Negative (FN)</b>	<b>True Positive (TP)</b>

$$\text{Error Rate} = \frac{FP + FN}{TN + FP + FN + TP} \quad \text{How often is the prediction wrong?}$$

**Defendants care  
about this**

$$\text{False Positive Rate} = \frac{FP}{FP + TN} \quad \text{How often were non-offenders  
predicted to reoffend?}$$

**Judges care  
about this**

$$\text{False Negative Rate} = \frac{FN}{FN + TP} \quad \text{How often were offenders  
predicted not to reoffend?}$$

# Error Estimation

Black Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	990 (TN)	805 (FP)
Outcome: Recidivated	532 (FN)	1369 (TP)

Error Rate  $\approx$  36.2%

White Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	1139 (TN)	349 (FP)
Outcome: Recidivated	461 (FN)	505 (TP)

Error Rate  $\approx$  33.0%

Similar error rates between white and black defendants

# Error Estimation

Black Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	990 (TN)	805 (FP)
Outcome: Recidivated	532 (FN)	1369 (TP)

Error Rate  $\approx 36.2\%$

False Positive Rate  $\approx 44.9\%$

White Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	1139 (TN)	349 (FP)
Outcome: Recidivated	461 (FN)	505 (TP)

Error Rate  $\approx 33.0\%$

False Positive Rate  $\approx 23.5\%$

Black defendants have 1.9x higher False Positive Rate!

# Why Fairness is Hard

Black Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	990 (TN)	805 (FP)
Outcome: Recidivated	532 (FN)	1369 (TP)

Error Rate  $\approx 36.2\%$

False Positive Rate  $\approx 44.9\%$

False Negative Rate  $\approx 28.0\%$

White Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	1139 (TN)	349 (FP)
Outcome: Recidivated	461 (FN)	505 (TP)

Error Rate  $\approx 33.0\%$

False Positive Rate  $\approx 23.5\%$

False Negative Rate  $\approx 47.7\%$

White defendants have 1.7x higher False Negative Rate

# Why Fairness is Hard

Black Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	990 (TN)	805 (FP)
Outcome: Recidivated	532 (FN)	1369 (TP)

White Defendants	Prediction: Low Risk	Prediction: High Risk
Outcome: No Recidivism	1139 (TN)	349 (FP)
Outcome: Recidivated	461 (FN)	505 (TP)

**Fairness  
through  
unawareness**

Surprising fact: COMPAS gives very different outcomes for white vs black defendants, but it does not use race as an input to the algorithm!

# Why **Fairness** is hard

 <b>Tension</b>	 <b>What it looks like in practice</b>	 <b>Take-away</b>
<b>Which metric to satisfy?</b>	Demographic parity, equalized odds, calibration, predictive parity ... you can't have them all at once ( <i>impossibility theorems</i> ). Choosing one redistributes harm/benefit.	Metric choice is a <b>normative</b> decision, not only technical.
<b>“Fairness through unawareness” doesn’t work</b>	Dropping the sensitive feature leaves proxies (zip code $\Rightarrow$ race, career gaps $\Rightarrow$ gender). The model re-learns group labels and bias becomes harder to spot.	Blindness $\neq$ fairness; <b>redlining could happen.</b>
<b>Data imbalance &amp; representation</b>	Minority classes often have sparse, noisy labels; majority groups dominate the loss signal. Over-sampling or re-weighting can help, but may inflate variance.	Garbage in $\rightarrow$ garbage out; <b>fix upstream data</b> as well as models.

# Types of Fairness

- Individual Fairness: Similar individuals should be treated similarly.
- Group Fairness: Outcomes of a decision making system should not differ systematically between two demographic groups.
- Counterfactual Fairness: Outcomes of an algorithm would not changed if in a counterfactual world if the individual had a different demographic characteristics.

# Hands on

```
31 def __init__(self, path):
32     self.file = None
33     self.fingerprints = set()
34     self.logdupes = True
35     self.debug = debug
36     self.logger = logging.getLogger(__name__)
37     if path:
38         self.file = open(os.path.join(path,
39                                     'fingerprint.log'), 'a')
40         self.file.seek(0)
41         self.fingerprints.update(e.request_fingerprint
42                                 for e in self.load(path))
43
44 @classmethod
45 def from_settings(cls, settings):
46     debug = settings.getbool('SUPERDUPE_DEBUG')
47     return cls(job_dir(settings), debug)
48
49 def request_seen(self, request):
50     fp = self.request_fingerprint(request)
51     if fp in self.fingerprints:
52         return True
53     self.fingerprints.add(fp)
54     if self.file:
55         self.file.write(fp + os.linesep)
56
57 def request_fingerprint(self, request):
58     return request_fingerprint(request)
```

## Part II: Measuring Unfairness

# Demographic Parity

Demographic parity is a fairness metric whose goal is to ensure a machine learning model's predictions are **independent** of membership in a sensitive group.

$$\mathbb{P}\{\hat{Y} = 1 \mid A = a\} = \mathbb{P}\{\hat{Y} = 1 \mid A = b\}.$$

		PREDICTED	
		Deny	Approve
TRUE	GROUP A Deny	1	2
	Approve	2	5

		PREDICTED	
		Deny	Approve
TRUE	GROUP B Deny	2	4
	Approve	1	3

Demographic parity

20 applicants (50% from **Group A**)  
14 approvals (50% from **Group A**)

# Equalized Odds

The goal of the equalized odds fairness metric is to ensure a machine learning model performs equally well for different groups.

It requires that the machine learning model's predictions are not only independent of sensitive group membership, but that groups have the same **false positive rates** and **true positive rates**.

$$\text{TPR} = \text{TP} / (\text{TP} + \text{FN})$$

$$\text{FPR} = \text{FP} / (\text{FP} + \text{TN})$$

## EQUALIZED ODDS

		PREDICTED		PREDICTED	
		Deny	Approve	Deny	Approve
GROUP	TRUE	3	1	6	2
	Approv	1	3	2	6
Group A: TPR 75% (3/4) FPR 25% (1/4)		• Group B: TPR 75% (6/8) FPR 25% (2/8)			

# Equality of Opportunity

Equal opportunity is a relaxed version of equalized odds that only considers **conditional expectations** with respect to positive labels, i.e.,

$$\mathbb{P}\{\hat{Y} = 1 \mid Y = 1, A = a\} = \mathbb{P}\{\hat{Y} = 1 \mid Y = 1, A = b\}$$

$$\text{TPR} = \text{TP} / (\text{TP} + \text{FN})$$

		PREDICTED	
		Deny	Approve
TRUE	GROUP A Deny	3	1
	Approve	2	4

		PREDICTED	
		Deny	Approve
TRUE	GROUP B Deny	6	1
	Approve	1	2

Equal opportunity

Group A: 66% true positive rate:  $4/(4+2)$

Group B: 66% true positive rate:  $2/(1+2)$

# Hands on

Coding Time

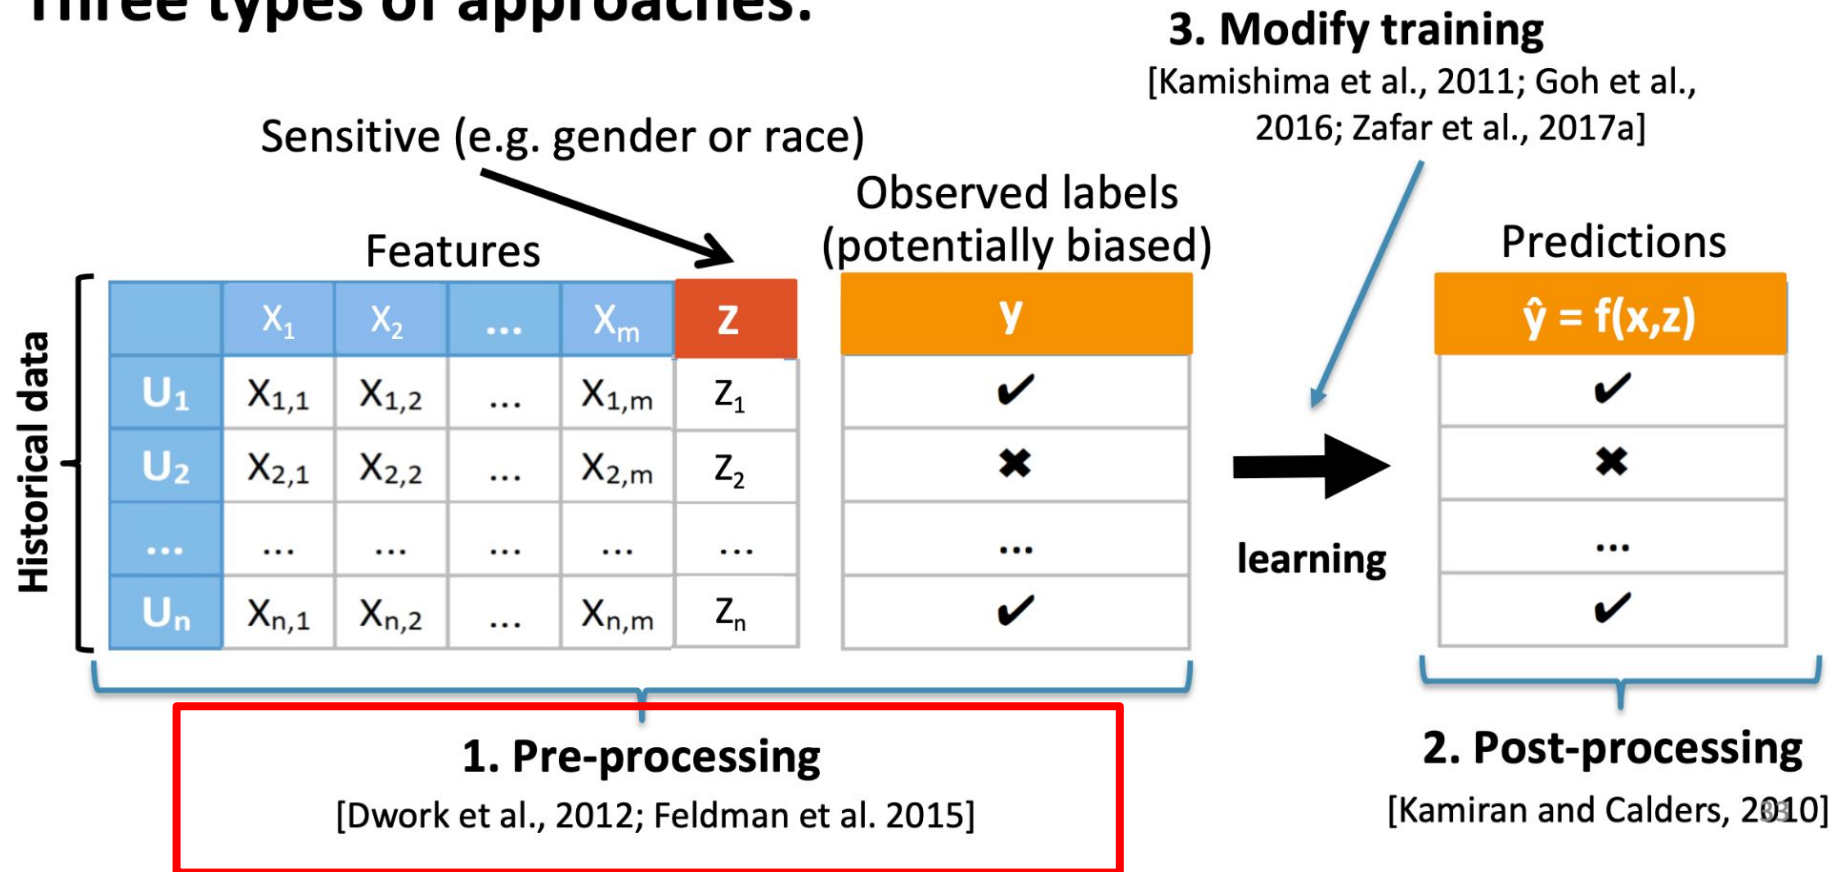

```
31 def __init__(self, path):
32     self.file = None
33     self.fingerprints = set()
34     self.logdupes = True
35     self.debug = debug
36     self.logger = logging.getLogger(__name__)
37     if path:
38         self.file = open(os.path.join(path,
39                                     'fingerprint.log'), 'a')
40         self.file.seek(0)
41         self.fingerprints.update(e.request_fingerprint(e) for e in self.requests)
42
43 @classmethod
44 def from_settings(cls, settings):
45     debug = settings.getbool('SUPERDUPE_DEBUG')
46     return cls(job_dir(settings), debug)
47
48 def request_seen(self, request):
49     fp = self.request_fingerprint(request)
50     if fp in self.fingerprints:
51         return True
52     self.fingerprints.add(fp)
53     if self.file:
54         self.file.write(fp + os.linesep)
55
56 def request_fingerprint(self, request):
57     return request_fingerprint(request)
```

## Part III: Mitigation Unfairness

# Fairness Mitigation Approaches

## Three types of approaches:

# Pre Processing Approach

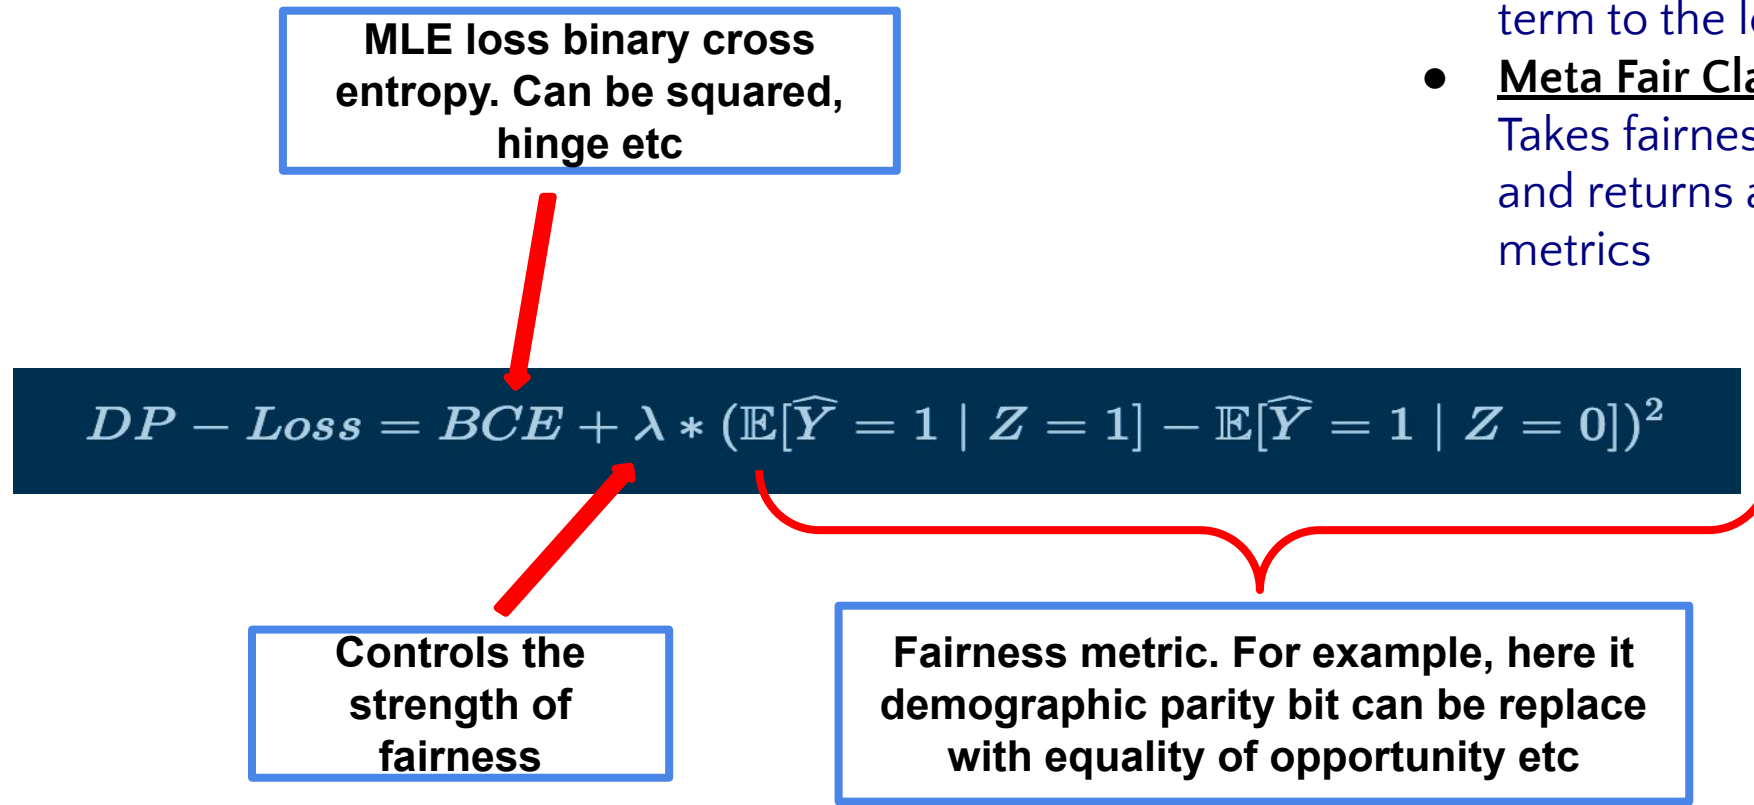

- Reweighting generates weights for the training samples in each (group, label) combination differently, ensuring fairness before classification
- Higher weights are assigned to instances that are underrepresented and lower weights are assigned to instances that are overrepresented.

## Additional methods:

- **Fair Representations**  
Finds a latent representation that encodes the data well.
- **Disparate Impact Remover**  
Edits feature values to increase group fairness while preserving rank ordering within groups

# In Processing Approach

Example using Demographic Parity as a metric

- **Adversarial Debiasing**  
Learns classifier to maximize prediction accuracy and simultaneously reduces adversary's ability to determine protected attribute from predictions
- **Prejudice Remover**  
Adds a discrimination aware regularization term to the learning objective
- **Meta Fair Classifier**  
Takes fairness metric as part of the input and returns a classifier optimized for the metrics

# Post Processing Approach

**Threshold Optimizer**

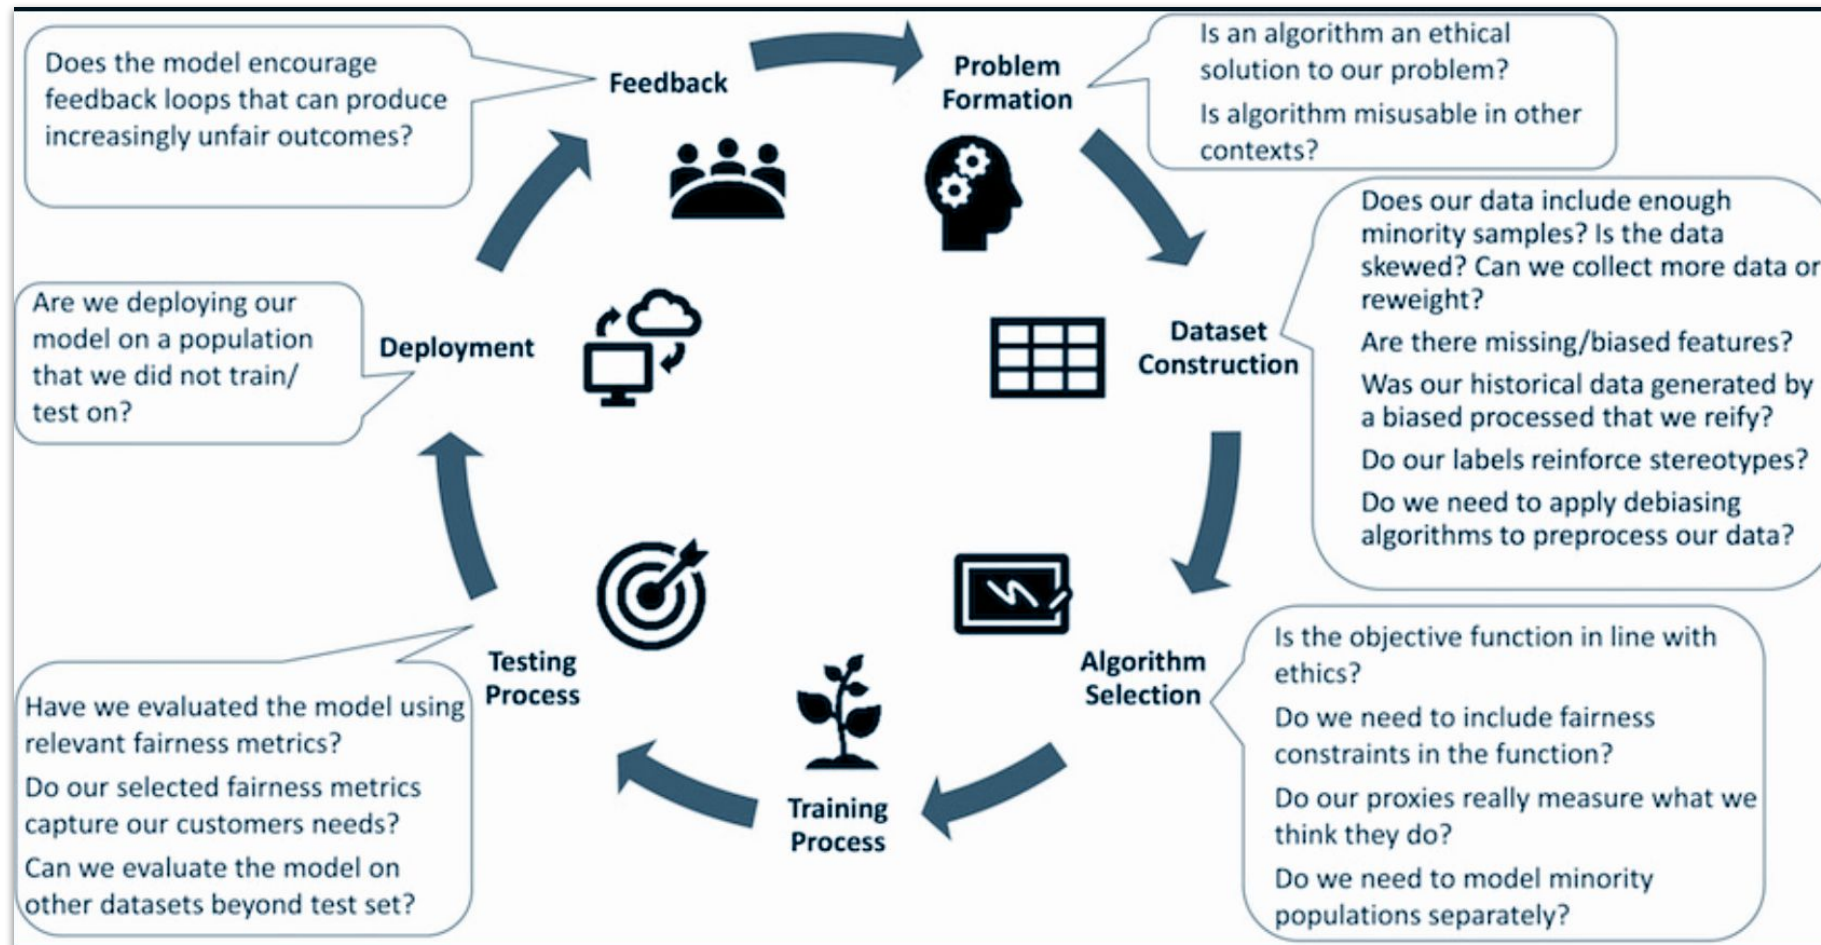

## Equalized Odds:

Modifies predicted label using an optimization scheme to make predictions more fair

# Building Fair Models

*Fairness-aware Machine Learning, Bennett et al., WSDM Tutorial (2019).*

# Take Home Message

- For **Ethical ML**, first **bear in mind the assumptions** – wrong assumption come often at a high social cost.
- Assumptions start with the **data collection process** – which features, data vs population distribution, feedback loops, etc.
- More realistic assumptions may require of **probabilistic approaches** (e.g., stochastic decisions).
- **Essential to have a holistic view of the algorithm** – starting from the data collection process before training, all the way to the deployment in the real-world.

*Not because something is technically possible,  
it is the right thing to do!*
